Cyber Threat Intelligence
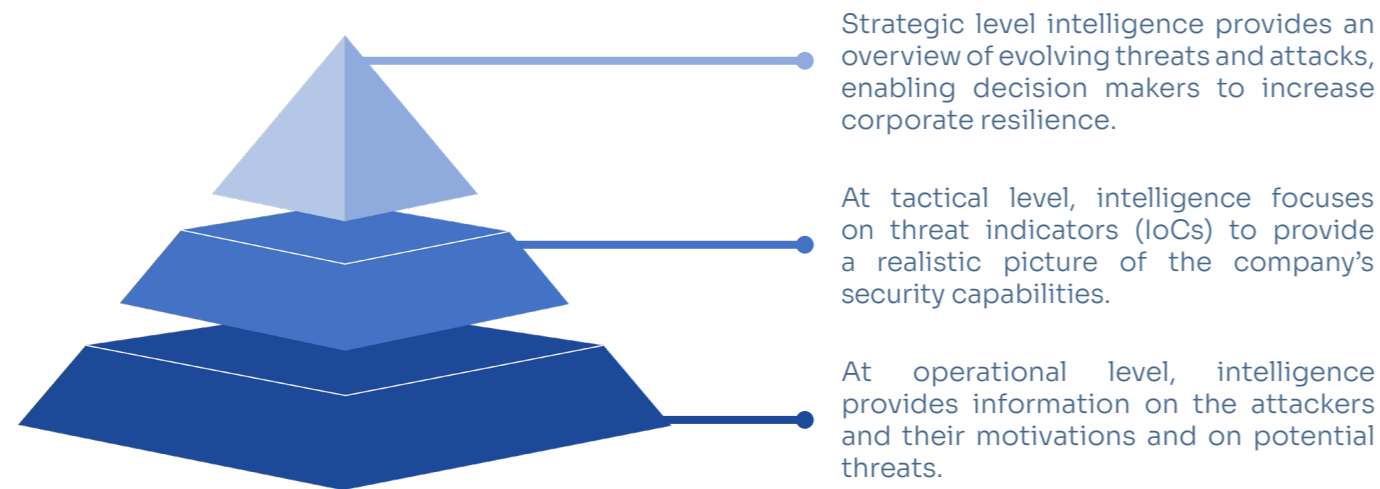

FUSION Service

Cyber Threat Intelligence
A powerful tool to maximise the effectiveness of your proactive defence

Cyber Threat Intelligence (CTI) involves collecting, analysing and utilising information on cyber security threats.
Diverse sources provide data on cyber threats and TTPs, enabling immediate identification, monitoring and blocking of threats. This leads to proactive and preventive defence, thereby protecting systems before they are attacked.

Our unique model

With a view to improving attack prevention and defining more comprehensive cyber risk mitigation and response strategies, the cyber threat intelligence FUSION service offered by DeepCyber and Cy4gate addresses the need to provide the three layers of CTI information:

Strategic level intelligence provides an overview of evolving threats and attacks, enabling decision makers to increase corporate resilience.

At tactical level, intelligence focuses on threat indicators (IoCs) to provide a realistic picture of the company's security capabilities.

At operational level, intelligence provides information on the attackers and their motivations and on potential threats.

The need
Strengthening cyber defence layers starting with proactive defence

The increasing number and intensity of cyber attacks is prompting the improvement of defence systems, notably through the use of proactive and preventive defence tools capable of neutralising threats before they can have any impact.

The solution
Cyber Threat Intelligence

By combining intelligence with monitoring and analysis of cyber threats, it is possible to create a successful containment strategy to address them. An effective defensive strategy is based on timely and constant tactical intelligence, which can be employed through the security operations centre (SOC). The information that is provided is contextualised vertically with regard to the intended use, i.e. they are related to the client's technological context and industry sector.
In addition to the CTI feeds, the clients are provided with the main actionable insights from the service in the form of reports that are also vertically contextualised by sector/industry of reference.

An advanced intelligence service
How is this solution different: benefits and distinguishing features

The cyber threat intelligence (CTI) FUSION service delivers added value that can be summarised in the following immediate benefits:

1. It allows the company to deploy CTI effectively while avoiding high investment costs for platforms and specialised expertise.
2. It provides daily acquisition of both commercial (Mandiant, Group-IB, etc.) and open source qualified CTI data sources.
3. It delivers immediately deployable intelligence thanks to contextualisation on the relevant technology area, in addition to all the most significant cross-cutting campaigns.
4. It provides regularly (even daily) customised reports based on clients' industries.

How it works

The service is provided by sharing aggregated, normalised and correlated CTI feeds, ready for use on cybersecurity systems, and collected on a daily basis from qualified sources (both commercial and open source) and specifically relating to the relevant industry sector. This allows to flexibly receive tactical intelligence, already processed and immediately usable on companies' security systems (Firewall, AV/AM, Web App Security/Web Filtering, etc.).

Feed analysis, management and dispatch

Daily CTI reports

Tactical CTI reports

Strategic CTI reports

Three subscription levels:

- **Silver version** - The client receives full tactical intelligence
- **Gold version** - The intelligence provided with the Silver version is enriched with information on the attackers and the operational methods used to carry out attacks
- **Advanced version** - The client receives the operational intelligence of the Gold version, but also benefits from dedicated on-demand support
